

Netscape

Title bar - Displays the title of the Web page currently in view.

Menu bar - Displays the standard Netscape menu options.

Location field - Displays the URL address for the file displayed. The address shows you where the page originated from.

Directory buttons - These buttons connect you to Web pages designed to help beginners become more familiar with the Web.

Status Indicator - This icon pulses when a link is in progress.

Progress bar - The red bar shows the progress of the downloading.

Document view window - The area where the Web page is displayed.

Security Indicator - The icon indicates whether the current page is secure. A solid highlighted key indicates a secure connection. A broken key indicates a connection that's not secure.

Link - Underlined or colored items that allow you to jump to a different Internet site from your current location.

Status Message - Displays the URL address of the link that you are currently pointing to. It also displays the progress of a link or download.

Toolbar - Includes the most frequently accessed menu commands.

Back - Goes back to the previous Web page.

Forward - Displays the next Web page in the history list.

Home - Displays your Home Page.

Reload - Reloads and redispays the current page.

Images - Displays inline images with the current page if they are not automatically loaded.

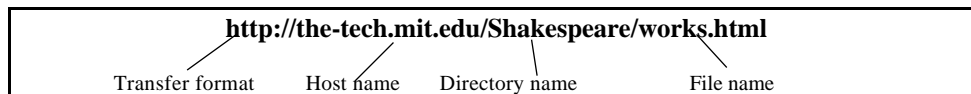

Open - Displays the *Open Location* dialog box where you can type an address of the Web page that you wish to retrieve.

Print - Prints the current page.

Find - Searches for a word or phrase within the current Web page.

Stop - Stops the transfer of Web pages from the Internet into the Document view window.

A URL (Uniform Resource Locator) is an address for a Web page. A typical URL consists of four parts:

URL's should be read from left to right. The first word followed by the colon and two slashes indicates the type of communication needed to access the file. **Http** refers to *Hypertext Transfer Protocol*, the main language which is used on the Web. The next group of words, **the-techmit.edu**, is the *host name* of the machine that holds the information. Everything after the machine's name, designates where the information is located on the machine. In the address example above, **Shakespeare**, is the *directory name* and **works.html**, is the actual *filename*.
